Fellsmere Wastewater Transmission System Update.....	Page 1
Evaluation of Lift Stations No. 1 & 2.....	Pages 2 & 3

List of Exhibits:

- Exhibit “A”: City of Fellsmere Monthly Billing Service Recap June, 2018
- Exhibit “B”: Map Showing Connections to Lift Station No. 1
- Exhibit “C”: Peak Factor Determination (from 10 State Recommended Standards for Wastewater Facilities)
- Exhibit “D”: Lift Station No. 1 Pump Curve
- Exhibit “E”: Future Development Map (North County Recycling Site Sketch)

Appendix “A” – Hydraulic Modeling Results Summary and Model Output

Appendix “B” – Updated Nodal Map (Aerial)

FELLSMERE WASTEWATER TRANSMISSION SYSTEM UPDATE

General:

This supplement is an update to the report titled "Hydraulic Analysis of Wastewater Transmission System for the City of Fellsmere, Florida", dated October 2005. In addition to updating the model, this supplement addresses and evaluates the City owned Lift Stations No.1 & 3 for their ability to handle existing and future connections.

Since the hydraulic model was first generated in 2005, three additional lift stations have been connected to the force main network. The new lift stations are located at Fellsmere Elementary School (LS No. 17), Dollar General Store (LS No. 18) and Fellsmere Inn (LS No. 15).

In reference to the 2005 report, the force main network is a system with independent variables at each pump station (varying levels in wet wells resulting in varying pump out rates). Because of this, it is important to understand there are an infinite number of operating conditions for the manifold wastewater system. Consequently, the operating criteria used to judge the acceptability and effectiveness of each pump station considers the extreme conditions as follows:

1. When examined at the extreme low pressure condition (pump station operating alone in the manifold) the pump station must pump in excess of its peak design flow.
2. When examined at the extreme high pressure condition (all pump stations operating in the manifold) the pump station must pump at or near its average daily flow.

While the low pressure pump station condition will occur often in a system of this size, it is realized the high pressure condition will occur infrequently, usually only after a prolonged power outage. It should be noted that some lift stations are equipped with back-up generators which will enable them to operate during a power outage. Because of this, it is less likely that all pumps would be running at the same time following a power outage. However, by utilizing these two lift station criteria, it is known the pump stations will operate between the two resulting pumping rates utilizing the existing manifold system.

The hydraulic modeling results of the updated Fellsmere Wastewater Transmission system are presented in Appendix "A". The updated system nodal map is presented on an aerial background as Appendix "B".

EVALUATION OF LIFT STATIONS NO. 1 & 2

A. Lift Station No. 1 (LS1)

The City's "Monthly Billing Service Recap" from June, 2018, indicates 27 Equivalent Residential Units (ERUs) are connected to LS1. (See Exhibits "A" & "B")

- Average Daily Flow = $27 \text{ ERU} \times 300 \text{ gpd/ERU} = 8,100 \text{ gpd} = 5.6 \text{ gpm}$
- Peak Factor = 4.3 (See Exhibit "C")
- Peak Design Flow = $4.3 \times 5.6 \text{ gpm} = 24 \text{ gpm}$
- Model Results (See Exhibit "D"): LS1 operating alone, $Q = 284 \text{ gpm}$; note: $284 > 24$
LS1 w/ all pumps on, $Q = 22 \text{ gpm}$; note : $22 > 5.6$
Consequently, both acceptance criteria are met.
- LS1 Connections Capacity (based on average flow criteria)
 $= 27 \text{ ERU}/5.6 \text{ gpm} \times 22 \text{ gpm} = 106 \text{ ERU}$
- Future Available ERUs = $106 \text{ ERU} - 27 \text{ ERU} = 79 \text{ ERUs}$

Notes:

1. The LS1 start-up report indicates the design condition was 250 gpm @72' TDH; while measured flows were approximately 511 gpm.
2. Design information on LS1 wet well was not available and therefore the wet well was not evaluated. However, because peak design flow to LS1 (24 gpm) is lower than the design condition (250 gpm) we can assume the wet well has adequate capacity.

B. Lift Station No. 3 (LS3)

The City's "Monthly Billing Service Recap" from June, 2018, indicates a total of 561 ERUs are connected to LS3.

- Average Daily Flow = $561 \text{ ERU} \times 300 \text{ gpd/ERU} = 168,300 \text{ gpd} = 117 \text{ gpm}$
- Peak Factor = 3.6 (See Exhibit "C")
- Peak Design Flow = $3.6 \times 117 \text{ gpm} = 421 \text{ gpm}$
- Model Results: LS3 w/ all pumps on receives: $Q = 591 \text{ gpm}$;
Based on LS3 start up, LS3 discharges a flow of $Q = 599 \text{ gpm}$
Note: $599 > 421 > 117$
Consequently, both acceptance criteria are met.

- LS3 Connections Capacity (based on peak flow criteria)
 $= 561 \text{ ERU}/421 \text{ gpm} \times 599 \text{ gpm} = 798 \text{ ERUs}$
- Future Available ERUs = 798 ERU – 561 ERU = 237 ERUs

Notes:

1. The LS3 start-up report indicates the start-up measured condition was 599 gpm @ 76' TDH and the design condition was 320 gpm @ 88' TDH
2. Design information on LS3 wet well was not available and therefore the wet well was not evaluated. However, because the peak design flow to LS3 (421 gpm) is higher than the design condition (320 gpm), we recommend that the LS3 wet well be evaluated.

***Include Future Development (N. County Recycling Site – 313 Units: See Exhibit “E”)**

- Average Daily Flow = 313 ERUs x 300 gpd/ERU = 93,900 gpd = 65 gpm
- Total Average Flow from City w/ New Development = 117 gpm + 65 gpm = 182 gpm
- Peak Factor = 3.5 (See Exhibit “C”)
- Peak Design Flow = $3.5 \times 182 \text{ gpm} = 637 \text{ gpm}$
- Model Results: LS3 w/ all pumps on or off, Q = 599 gpm; note : $599 > 182$
 However, $599 < 637$
 Consequently the acceptance criteria is met for the average flow condition but not for the peak flow condition. Improvements to LS3 would be required.
